61a A&P: Respiratory System

61a A&P: Respiratory System Class Outline

5 minutes Attendance, Breath of Arrival, and Reminders

10 minutes Lecture:

25 minutes Lecture:

15 minutes Active study skills:

60 minutes Total

61a A&P: Respiratory System

Class Reminders

ABMP Exam Coach

- "Access your ABMP account" using instructions on page A-74
- Familiarize yourself with ABMP Exam Coach, especially the "Study Subjects" section
- Preview the preparation assignments for MBLEx Prep classes (74a, 75a, 80a, 81a, 84a, 86a, 87a)

Assignments:

- 62a Deep Tissue: Outside Massages (due before class starts)
- 64b Executive Summary (due before the end of class)
 Packet pages 21-22; Sections 1-4 to be done *in* class.
 completed Executive Summary to be handed in at end of class.
- 66a Review Questions (due before class starts)

Quizzes and Exams:

- 62b Deep Tissue: Touch Assessment Bring your grading sheet for evaluation A: 83
- 66a Quiz (59a, 61a, 62a, 63a, 64a,/b, 65a/b)
- 68a Kinesiology Quiz

Preparation for upcoming classes:

62a Pathology: Respiratory System
 Packet E: 151-152.; RQ – Packet A-198.

Classroom Rules

Punctuality - everybody's time is precious

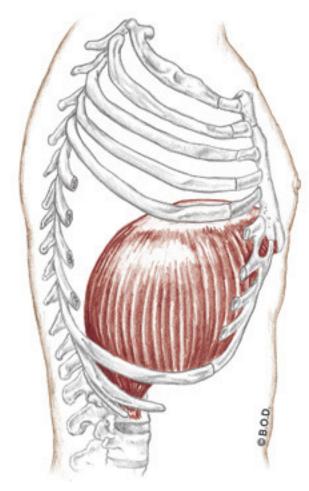

- Be ready to learn at the start of class; we'll have you out of here on time
- Tardiness: arriving late, returning late after breaks, leaving during class, leaving early

The following are not allowed:

- Bare feet
- Side talking
- Lying down
- Inappropriate clothing
- Food or drink except water
- Phones that are visible in the classroom, bathrooms, or internship

You will receive one verbal warning, then you'll have to leave the room.

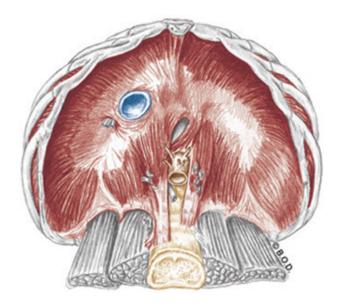

Diaphragm Trail Guide, Page 213

Lateral View

The **diaphragm** is the primary muscle of respiration.

It has a broad, umbrellalike shape that separates the thoracic cavity from the abdominal cavity.

Inferior View

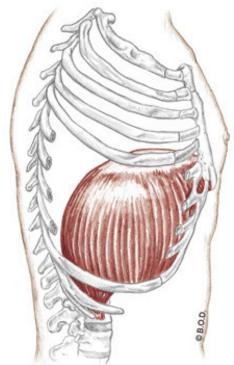

A Draw down the central tendon of the diaphragm

Increase the volume of the thoracic cavity during inhalation

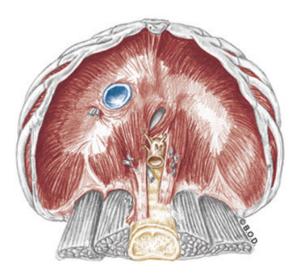

- Costal attachment: Inner surface of the lower 6 ribs

 Lumbar attachment: Upper 2 or 3 lumbar vertebrae

 Sternal attachment: Inner part of the xiphoid process
- Central tendon

61a A&P: Respiratory System

Packet E - 145

Introduction

Respiration Movement of air in and out of the <u>lungs</u>, and the exchange of oxygen and carbon dioxide between the blood and body tissues.

The respiratory and <u>cardiovascular</u> systems work together to provide oxygen to the tissues and remove metabolic wastes including carbon dioxide.

Failure of either system results in disruption of <u>homeostasis</u> and rapid cell death from oxygen deprivation.

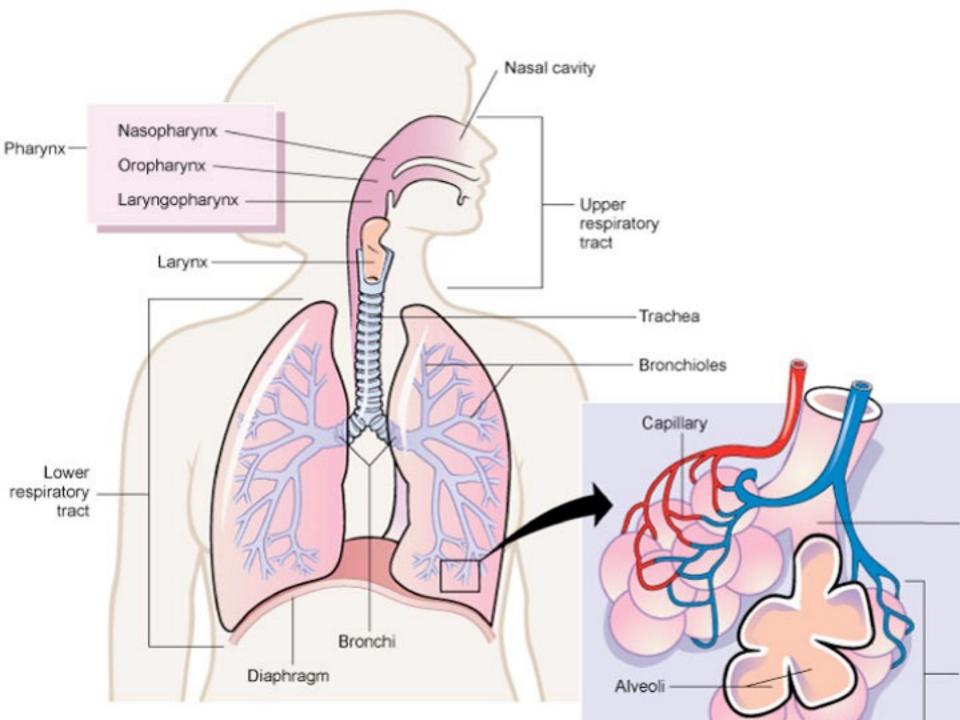

Anatomy

Upper respiratory tract

- Nose and nasal cavity
- Pharynx
- Larynx
- Sinuses

Lower Respiratory tract

- Trachea
- Bronchi and Bronchioles
- Alveolar ducts and alveoli
- Lungs
- Diaphragm

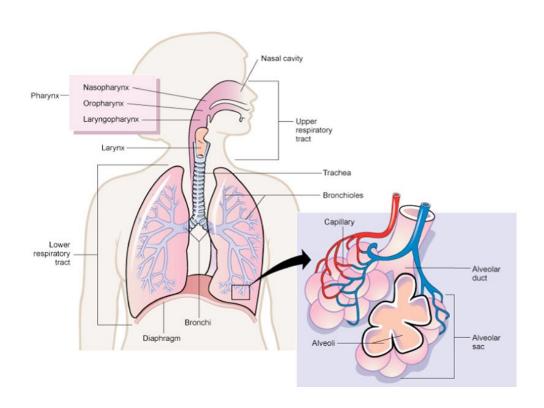

Exchange gases

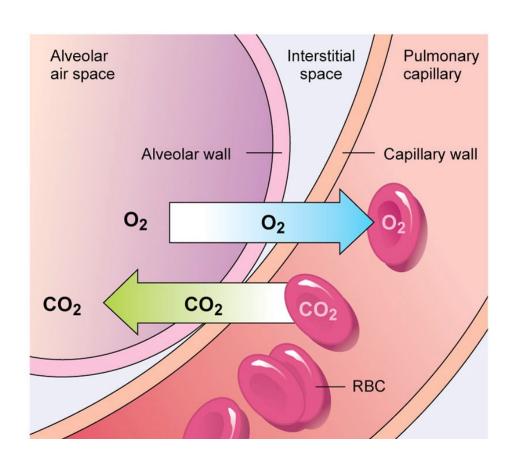

Olfaction

Sound production

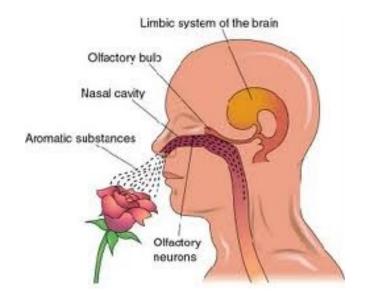

Maintenance of homeostasis

Exchange gases Oxygen and CO2 exchange occurs through the capillary walls in the lungs and in the systemic circulation.

Olfaction The sense of <u>smell</u>. During inhalation, scent molecules are forced against ends of the olfactory nerves which connect to the olfactory bulb. The nerve impulse is then carried to the cortex for interpretation.

Sound production Air moving over the <u>vocal</u> <u>cords</u> combined with movements of the lips, facial muscles, and tongue forms words and produces speech.

Maintenance of homeostasis Maintains oxygen levels in the <u>blood</u>.Eliminates wastes such as carbon dioxide and heat. Also regulates blood <u>pH</u>.

Response Moment

The 4 physiologies of the Respiratory System:

- 1.
- 2
- 3.
- 4.

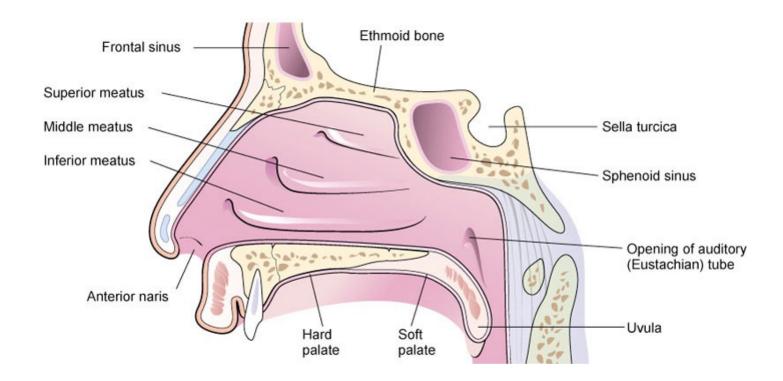

Response Moment

The 4 physiologies of the Respiratory System:

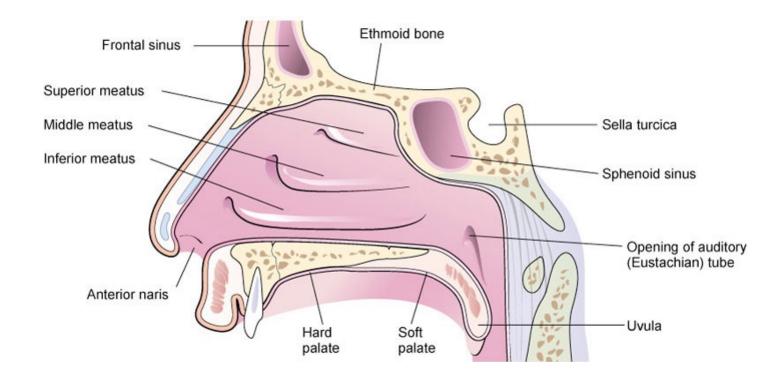

- 1. Exchange of gases
- 2. Olfaction
- 3. Sound production
- 4. Maintenance of homeostasis

Nose Port of entry for air and the beginning of the air conduction pathway.

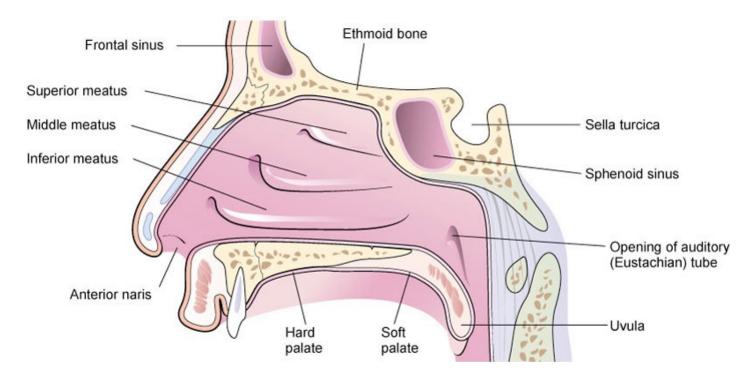

Nasal hair Traps particles and foreign matter as air flows through the nose.

Nasal cavity Cavity just behind the nose where air is <u>warmed</u> by superficial blood vessels and <u>moistened</u> by mucosal secretions.

Cilia Tiny hair-like projections of the mucosae that trap foreign particles and transport them down the throat where they are either swallowed or coughed out through the mouth.

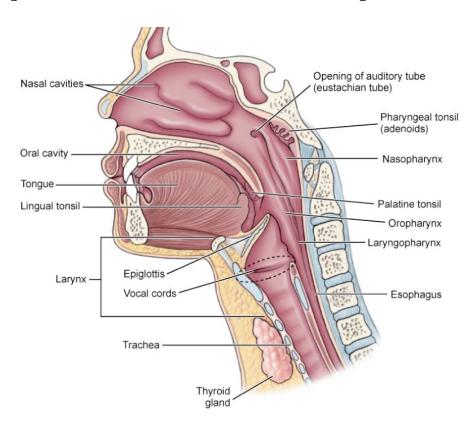

Pharynx (AKA: throat) ____ Muscular __ tube shared by the respiratory and digestive systems. Contains tonsils and openings to the Eustachian tubes.

Larynx (AKA: voice box) Connects the pharynx to the <u>trachea</u>.

Houses the vocal cords where sound is produced when air passes over them.

Epiglottis Elastic cartilage in the larynx that closes the trachea during swallowing to prevent food and water from entering the lower respiratory tract.

Response Moment

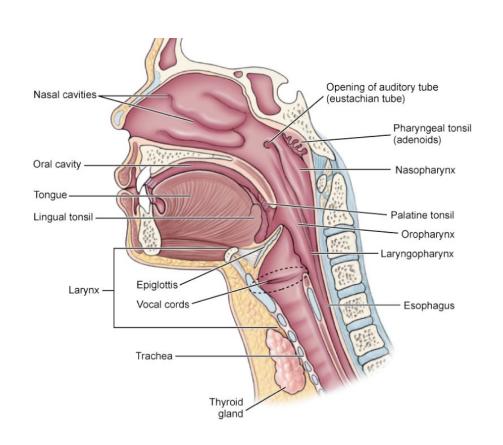

7 anatomical features of the upper respiratory tract:

- 1.
- 2
- 3.
- 4.
- 5.
- 6.
- 7.

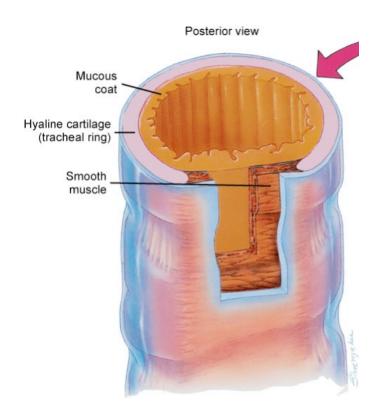

Response Moment

7 anatomical features of the upper respiratory tract:

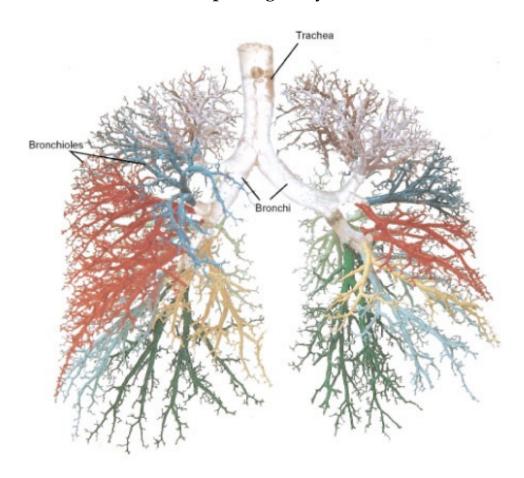

- 1. Nose
- 2. Nasal hairs
- 3. Nasal cavity
- 4. Cilia
- 5. Pharynx
- 6. Larynx
- 7. Epiglottis

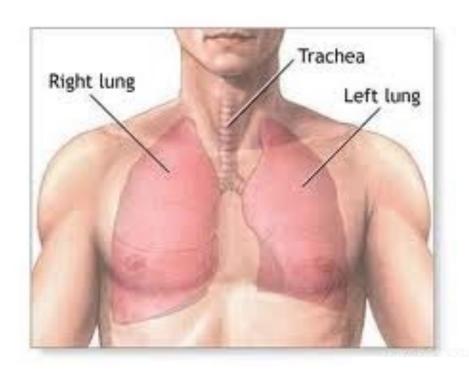

Trachea (AKA: windpipe) Tube that connects the larynx to the <u>lungs</u>.

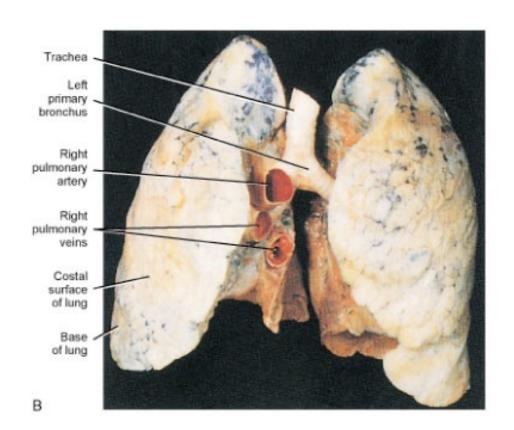

Primary bronchi Air conduction passageways from the trachea to each lung.

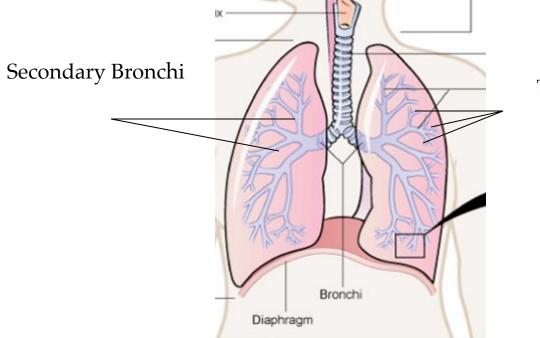

Lungs Primary organs of respiration. Extend from the diaphragm to just above the clavicles. Right lung has 3 lobes. Left lung has 2 lobes.

Lungs Primary organs of respiration. Extend from the diaphragm to just above the clavicles. Right lung has 3 lobes. Left lung has 2 lobes.

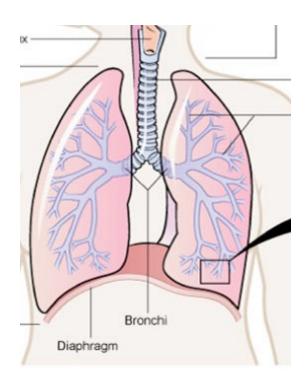

Secondary and tertiary bronchi (not detailed in Salvo) Branches from the primary bronchi, similar to them but decreasing in size.

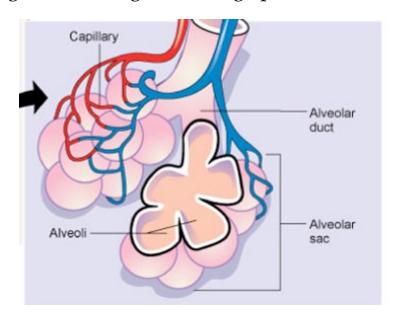

Tertiary Bronchi

Bronchioles Smaller branches off the tertiary bronchi, having no cartilage, and surrounded by smooth muscle.

Alveolar ducts Connect bronchioles to alveoli.

Alveoli Tiny <u>sacs</u> attached in clusters resembling grapes to alveolar ducts. Made of single-layer epithelial tissue and surrounded by capillaries which together make gas exchange possible.

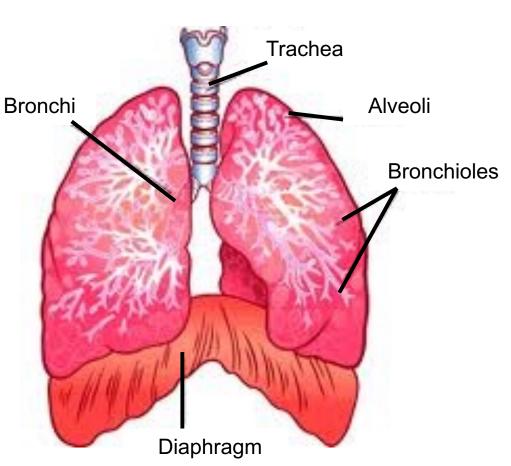

Response Moment

7 anatomical features of the lower respiratory tract:

- 1.
- 2
- 3.
- 4.
- 5.
- 6.
- 7.

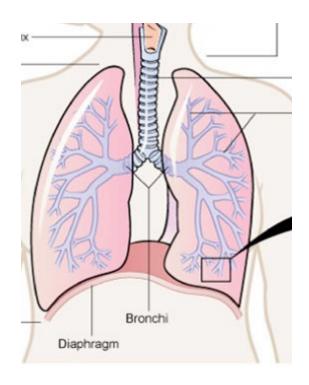

7 anatomical features of the lower respiratory tract:

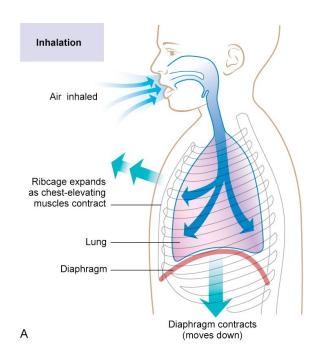

- 1. Trachea
- 2. Primary bronchi
- 3. Lungs
- 4. Secondary and tertiary bronchi
- 5. Bronchioles
- 6. Alveolar ducts
- 7. Alveoli

Diaphragm

Diaphragm Main <u>muscle</u> of respiration and structure separating the thoracic cavity from the abdominal cavity.

Main organ of respiration?

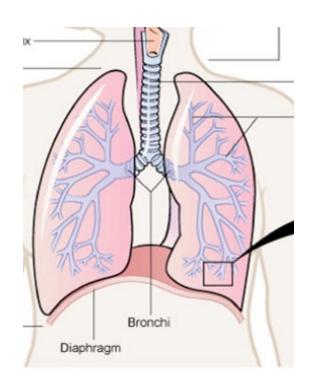

Main muscle of respiration?

Main organ of respiration?

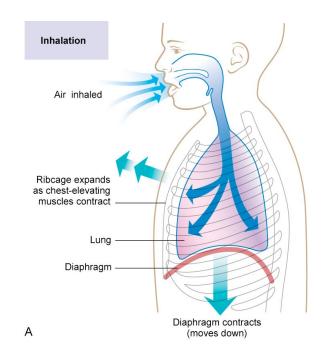

- Lungs

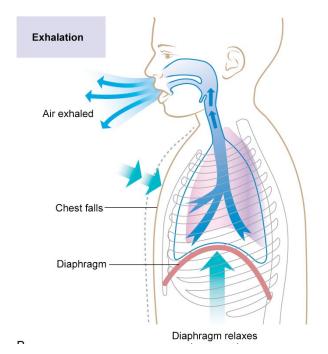

Main muscle of respiration?

Diaphragm

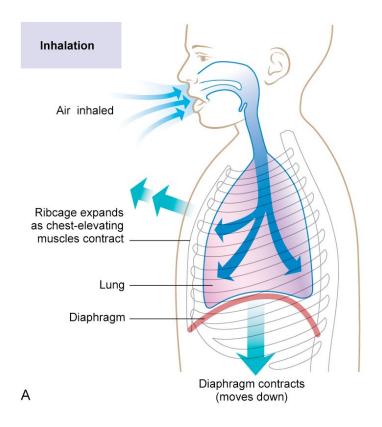

Breathing A <u>mechanical</u> action consisting of two phases: inhalation (inspiration) and exhalation (expiration). These phases are the result of nerve stimulation, muscle contraction, and differences between the pressure in the lungs and the atmospheric pressure outside the lungs. Adults breathe 12-16 times per minute.

Inhalation (AKA: inspiration) Process of drawing air into the lungs.

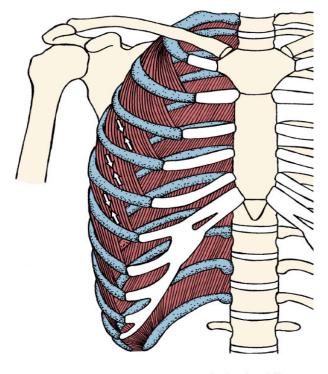

- 1. Diaphragm contracts and moves down.
- 2. External intercostals contract to lift the ribcage up and out.
- 3. Pressure in the lungs is now lower compared to atmospheric pressure.
- 4. Air moves from higher pressure (atmosphere) to lower pressure (lungs).

Inhalation (AKA: inspiration) Process of drawing air into the lungs.

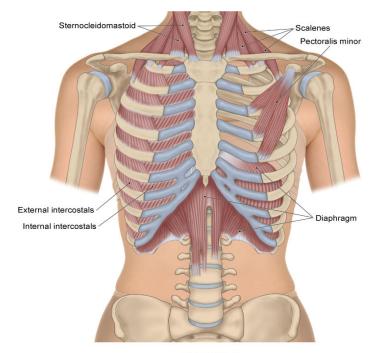

- 1. Diaphragm contracts and moves down.
- 2. External intercostals contract to lift the ribcage up and out.
- 3. Pressure in the lungs is now lower compared to atmospheric pressure.
- 4. Air moves from higher pressure (atmosphere) to lower pressure (lungs).

Anterior View

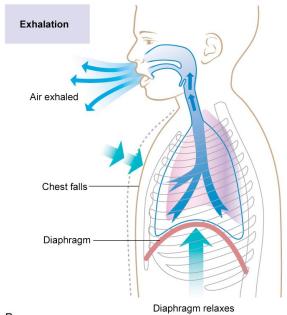

Forced inhalation Intensified and voluntary inhalation that requires contraction of <u>accessory</u> muscles of inhalation (sternocleidomastoid, scalenes, and pectoralis minor).

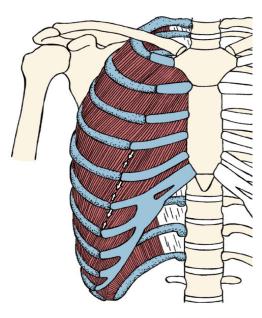

Anterior View

Exhalation (AKA: expiration) Process of expelling air from the lungs.

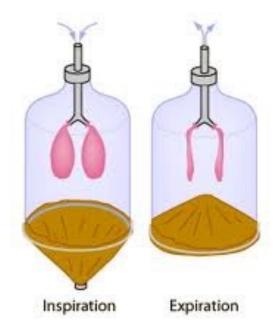

- 1. Diaphragm relaxes; elastic recoil of stretched tissues causes it to rise up.
- 2. External intercostals relax; elastic recoil of the stretched tissues causes the ribcage to move down and in.
- 3. Thoracic cavity and lungs are reduced in size as a result.
- 4. Pressure in the lungs is now higher compared to atmospheric pressure.
- 5. Air moves from higher pressure (lungs) to lower pressure (atmosphere).

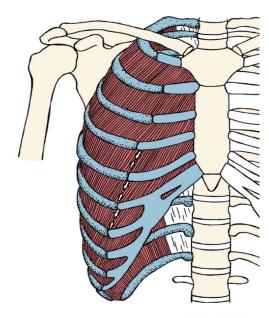

Exhalation (AKA: expiration) Process of expelling air from the lungs.

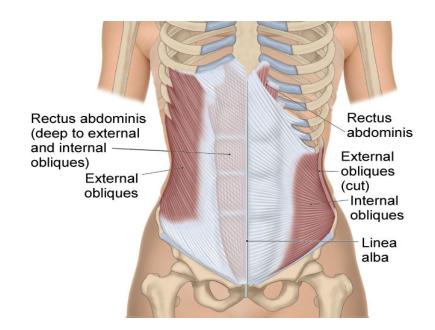

- 1. Diaphragm relaxes; elastic recoil of stretched tissues causes it to rise up.
- 2. External intercostals relax; elastic recoil of the stretched tissues causes the ribcage to move down and in.
- 3. Thoracic cavity and lungs are reduced in size as a result.
- 4. Pressure in the lungs is now higher compared to atmospheric pressure.
- 5. Air moves from higher pressure (lungs) to lower pressure (atmosphere).

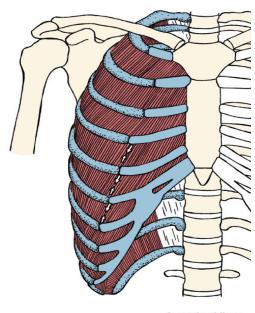

Anterior View

Forced exhalation Intensified and voluntary exhalation that requires contraction of accessory muscles of exhalation (internal intercostals and abdominals).

Anterior View

Volitional/voluntary breathing Allows you to <u>hold</u> your breath while swimming under water and to take <u>deep</u> breaths to project your voice during public speaking.

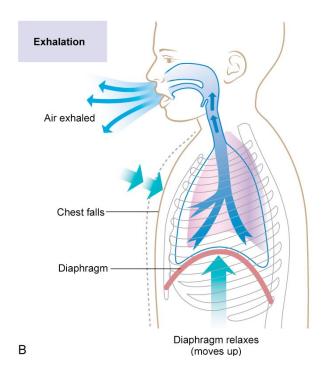

4 steps of inhalation?

- 1.
- 2.
- 3.
- 4.

4 steps of inhalation?

- 1. Diaphragm contract and moves down
- 2. External intercostals contract to lift the ribcage up an out
- 3. Pressure in the lungs is now lower compared to atmospheric pressure
- 4. Air moves from higher pressure (atmosphere) to lower pressure (lungs)

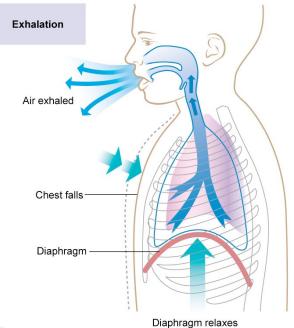

5 steps of exhalation?

- 1.
- 2
- 3.
- 4.
- 5.

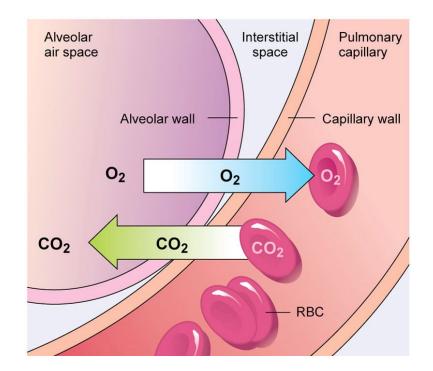

5 steps of exhalation?

- 1. Diaphragm relaxes; elastic recoil of stretched tissues causes it to rise up
- 2. External intercostals relax; elastic recoil of the stretched tissues causes the ribcage to move down and in
- 3. Thoracic cavity and lungs are now reduced in size as a result
- 4. Pressure in the lungs s now higher compared to atmospheric pressure
- 5. Air moves from higher pressure (lungs) to lower pressure (atmosphere)

External and Internal Respiration

External respiration (AKA: pulmonary respiration) Gas exchange in the lungs. Occurs by diffusion between blood in capillaries and air in the alveoli.

External and Internal Respiration

Internal respiration (AKA: tissue respiration) Gas exchange between blood and the body <u>tissues</u>.

Definition of respiration?

Site of external respiration?

Site of internal respiration?
